SUMMARY

Six years building the systems behind reporting and now moving into analytics while finishing a Master's in Business Analytics at KSBL. I built reporting that a vehicle-parts distributor used to calculate payments to buyers based on their purchase volume, so the definitions behind those numbers had to be agreed on and correct before anyone acted on them. I've also seen how output can look complete when it isn't, which is why I check figures against the source system rather than simply trusting the report. I write and validate SQL myself. Nowadays, I also work with Power BI including star schemas, fact and dimension tables, and DAX throughout the Data Analysis and Modeling course at KSBL. I work directly with clients in the UK and Denmark, agreeing scope and release content in writing.

SKILLS

SQL & data: PostgreSQL and MySQL — complex queries, stored procedures, window functions, views, joins across systems, data modelling and migrations; reconciling records that do not match cleanly between sources; data validation and idempotent writes so a re-run never duplicates data

Requirements & specification: translating what stakeholders ask for into something a build team can implement — metric definitions agreed and written down, API contracts documented in Swagger/OpenAPI, scope and release content agreed in writing with clients in other timezones; validating output against the source system before it is relied on

BI & data modelling: Microsoft Power BI (certified) — built a model and dashboard in the MSBA Data Analysis & Modeling course, covering star schema, fact and dimension tables, relationships, DAX measures, Power Query transformations and time-intelligence; Excel

Commercial & compliance: loyalty points and the reporting used to settle buyer payouts; transaction tracking between farmers and produce-market traders; tiered subscription billing; GDPR-driven data handling on a deployed platform — hard delete, anonymization and export flows, and keeping personal data out of places it does not belong

Engineering: Node.js, TypeScript, NestJS, PHP (Laravel), REST APIs, Docker, GitHub Actions, AWS (Lambda, RDS, S3, EC2), Git

ANALYTICS PROJECT

MSBA Capstone — what keeps people using a calorie-tracking app

2026 – in progress

- Research design for a survey study (minimum 400, target 600 respondents) on which features keep users logging: MaxDiff to rank eight candidate features, k-means with Ward's method to segment users, and regression with segment-by-need interaction terms to find what drives intention to keep using the app.
- Designed to separate what is merely correlated from what drives behaviour, with quotas on tracking experience, gender and age so the segments can be compared fairly.

EXPERIENCE

Independent Consultant · Remote · Karachi, Pakistan

Jan 2026 – Present

Backend and data work for UK SaaS clients, plus engagements in Denmark and Pakistan

- **Spot —** B2B workplace wellbeing platform, deployed on Render, with Stripe Connect tiered subscription billing and data handling built for GDPR-driven data handling on a deployed platform — hard delete, anonymization and export flows. 357 automated tests and 18 database migrations. Fixed a daily job that was skipping records because it was filtering on the wrong column. Some contacts and accounts were never being processed, but nothing failed or appeared in the logs, so the output looked complete. I traced the issue to the filter, fixed it, and tested the change against a local copy of the real data before releasing it.
- **Groops**— Platform for organizations for the same UK client. I started the project at Blocship and continued working on it directly from January 2026. I built an analytics module covering revenue, paying members, revenue by source group, and demographics of paying users. For each metric, I documented the counting rules and referenced them by ID, **for example**, excluding refunds and chargebacks, rounding percentages so breakdowns added up to exactly 100%, and identifying buyers from the transaction rather than the commission recipient. Month-end snapshots keep historical figures from changing, while a reconciliation job runs every five minutes to find payments that were never attributed to a group.
- **ALLDost (Active LifestyLe Dost)** —Built with Next.js and Supabase, using the Gemini API to turn plain-language entries into structured nutrition records. I'm currently building a review workflow where a qualified nutritionist can correct AI-generated data, with every entry treated as unverified until it has been reviewed. Around five friends-and-family users. It's a portfolio product, not a business.

Software Engineer · Blocship · Karachi, Pakistan May 2023 – Dec 2025

Backend development across six products, in a team with frontend, product, design and QA

- **Loyalty points for a vehicle-parts distributor —** NestJS backend for a QR-code points system handling issuance, redemption and transfer, with balance changes written transactionally so a failed transfer could not leave value in two places at once. I built the points reporting the distributor used to pay back its buyers according to the boxes they had bought.
- **Apna Khata —** app for Pakistan's produce markets (sabzi mandi), built on Laravel, where farmers sold fruit and vegetables to market traders at the rates they were offered. I built the tracking of transactions between them.
- **MaidMe —** home services marketplace in Norway. The live Laravel backend could not handle socket connections, so I added a NestJS socket server alongside it for real-time booking management and support chat.
- **Groops —** platform for organizations on NestJS with Clean Architecture: 16 modules, 73 database migrations, 81 entities and 472 test suites.
- **Across all six:** MySQL and PostgreSQL data modelling and migrations, code review, and production support.

Freelance · Upwork 2023 – 2024

- Built a Laravel product catalogue for an industrial HVAC-parts seller with a request-for-quote flow feeding an admin dashboard — a lead-generation site, with sales closed outside the system (Oct 2023). Deployed a REST API to Google Cloud for an enterprise client (Mar–Apr 2024). Both rated 5.0.

Software Engineer · Sybrid (Pvt) Ltd · Karachi, Pakistan Apr 2021 – May 2023

- **MySQL stored procedures using window functions** to persist candidate profiles and calculate a profile score server-side, keeping the scoring logic in one place.
- **FiTE —** engineer hiring portal for Japanese companies. Laravel, bilingual in English and Japanese, with role-based access control across four user groups.

Associate Developer · TAFSOL Technologies · Karachi, Pakistan Sep 2020 – Apr 2021

- Digital sports agency platform where players and coaches registered and, depending on their agency membership, gained access to a video library. Laravel, with payment gateway integration and an e-store. Employee of the Month, October 2020.

EDUCATION

Master's in Business Analytics (MSBA) · Karachi School of Business & Leadership 2025 – 2026

Final semester — coursework in Data Modeling, SQL, Machine Learning, Generative AI and Mining the Web; decision sciences, predictive modelling, financial analysis and business intelligence

BSc Computer Science · SZABIST, Karachi 2016 – 2020

CERTIFICATIONS

Microsoft Power BI · Generative AI with Large Language Models — DeepLearning.AI with AWS · Introduction to Cloud Computing — IBM (2025) · Git and GitHub Essentials — IBM (2025)
